

## MailGate

### E-mail notification in your pocket.

The Ascom gateway tool to the Internet, MailGate, transfers e-mail information to people on the move. By using a special address, an Internet message can be forwarded directly to a person waiting for an important e-mail. A notification is then instantly sent out to the person's telephone or pager and the person can act immediately.

#### **Ascom uses the Internet**

For people on the move in their workplace, Ascom extends the accessibility to include Internet mail technology. Today, messages arrive in written form via e-mail and often replace phone calls, faxes, etc. People who are seldom at their desk – if they have one – become even harder to reach since they are not aware of an incoming e-mail. The risk of missing important information sent electronically is becoming higher for every day since many machines, for example in a production line, automatically send electronic fault messages. This information is vital and must be handled immediately which has resulted in a need for e-mail notification.

#### **E-mail your telephone**

Ascom provides the solution with our IP-messaging tool MailGate which interfaces to your mail system. This gives you e-mail notification directly in your telephone or pager as soon as an awaited e-mail arrives.

MailGate is interfaced to all mail servers or clients supporting SMTP. Functionality, such as filtering and forwarding conditions, varies depending on the available features in the existing mail server.

#### **Unique e-mail address**

Each telephone or pager in the Ascom system gets a unique e-mail address and parts of an incoming e-mail are automatically forwarded and displayed on the unit. The user knows directly if the received e-mail needs immediate attention or can wait until later to be read. If the message is short, it can be read in full on Ascom telephones and pagers.

MailGate expands the use of your existing telephone or paging system. It gives you a higher performance rate and secures the forward compatibility of your Ascom radio communication system.

## **Features and Benefits**

---

### **E-mail notification**

---

E-mail information reaches people on the move.

---

### **TCP/IP based communication**

---

Interfaces to all mail servers and/or clients supporting SMTP.

---

### **Stand-alone solution**

---

Can be interfaced to any equipment sending SMTP e-mail.

---

### **Robust and reliable**

---

MailGate e-mail server runs on dedicated hardware.

---

### **Easy to install**

---

Pre-installed software for fast installation.

---

### **Easy to maintain**

---

Forwarded e-mail information is centrally set.

---

### **Easy administration**

---

All settings done through web-browser for authorised users.
