

Ascom Wanderer Control

Stop wondering about wandering

Dementia is a big problem for the elderly. More than one in five over the age of 80 suffers from this condition. The consequences are distressing – for the patients, their families and those entrusted with their care.

Some elderly patients have a tendency to go for unannounced walks, which makes them not only a potential danger to themselves but also a worry to those looking after them. There is a solution...

Keep track and save time

Thanks to Ascom's Wanderer Control system, a part of our Hentmax concept, you can keep a discreet eye on your patients/residents – with no effort at all. The system does all the work for you, providing you with updates right in your pocket. Gone are the days when you or your staff have to go looking for wandering patients or residents.

An open door

Wanderer Control allows you to maintain an open door policy. Because patients prone to wandering are tagged and monitored, stress is minimised and the atmosphere remains friendly, relaxed and productive. Energy is not wasted on finding 'missing' persons or reassuring anxious relatives – which helps to make your staff feel they're providing a good service. Ultimately, this will translate into enhanced operational efficiency.

Exit prohibited

The system is designed to sound the alarm – in your pocket – should a patient attempt to leave your premises unattended. Every attempt to depart is registered, including the identity of the patient or resident, giving your staff not only plenty of time to intervene but also to tailor their response to the individual in question. The result? Care and safety are both improved.

Tagging other valuables

Though ideal for tagging wandering patients, Ascom's Wanderer Control can also help you keep a watchful eye on valuable equipment or newborn babies. Whatever the demands of your operation, you can be sure that Wanderer Control will help your organization become more responsive, agile and productive.
